

# TCP Throughput

①

Instantaneous  
throughput ( $S$ )

Average  
throughput ( $S_{avg}$ )

- Assume TCP congestion window ( $CW$ ) of  $W$  segment
- Assume no slow start. (operating in AIMD)
- Round-trip time of  $RTT$  seconds
- Segment size of  $MSS$  bytes/segment

congestion  
avoidance  
phase

Q: What is the average throughput of TCP?

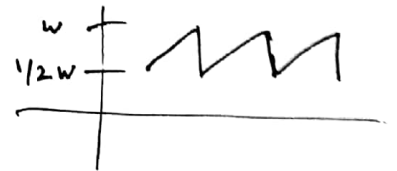

A: at  $CW = W$ , sending rate ( $S$ )

$$S = \frac{W \cdot MSS}{RTT} \quad \text{bytes/sec}$$

at  $CW = W \Rightarrow$  Triple duplicate ACK (TDA)

$\Rightarrow$  mult. decrease  $\Rightarrow CW = W/2$

$$S' = \frac{1}{2} S$$

Avg. Throughput:

$$S_{avg} = \frac{S + \frac{1}{2}S}{2} = \frac{3}{4}S$$

$$= \frac{\frac{3}{4}W \cdot MSS}{RTT} \quad \text{bytes/sec}$$

## TCP over fast links

②

$$\text{Link capacity} = 10 \text{ Gbps} = 1.25 \text{ GBps}$$

$$\text{MSS} = 1500 \text{ bytes/segment}$$

$$\text{RTT} = 100 \text{ ms} = 0.1 \text{ sec}$$

Q: What is the required window size?

$$S = \frac{W \cdot \text{MSS}}{\text{RTT}} \quad \text{bytes/sec}$$

$$W = \frac{S \cdot \text{RTT}}{\text{MSS}} \quad \text{segments}$$

$$= 83,333 \text{ segments}$$

## Resource allocation

(3)

Q: 3 users, 90 Mbps link (3 users are competing for 90Mbps)

U1  $\rightarrow$  50 Mbps  
U2  $\rightarrow$  50 Mbps  
U3  $\rightarrow$  10 Mbps

} user request or requirement

Fair allocation: ?? It depends!!

Fair

- equal (30, 30, 30)
- proportional (41, 41, 8)
- max-min (40, 40, 10)

Fair, efficient, good, optimal, best  
 $\rightarrow$  have to give them meaning.

TCP-fair: (30, 30, 30)

# TCP Reno with SS/AIMD

(4)

SS:  $CW = 2 \text{ MSS}$

$ss_{thresh} = 8$

Timeout  $\rightarrow 5^{th} \text{ Tx}$

$CW = ?$  after  $10^{th} \text{ Tx}$

$\text{Tx } 1: CW = 2$

$\text{Tx } 2: CW = 4$

$\text{Tx } 3: CW = 8$

} Slow start

$\text{Tx } 4: CW = 9$

$\text{Tx } 5: CW = 10$

} AIMD

$\text{Tx } 6: CW = 2$

← Timeout  
 $ss_{thresh} = 5$

$\text{Tx } 7: CW = 4$

} SS

$\text{Tx } 8: CW = 5$

} AIMD

$\text{Tx } 9: CW = 6$

$\text{Tx } 10: CW = 7 \checkmark$
