Exercise 2.1

Proof for $\mathcal{X} = \{0, 1, \dots, k-1\}$, we set $\{p_1, p_2, \dots, p_k\}$ be the pmf for X

And following the $f(x) = -\log x$ is concave function in $[0, 1]$

~~And~~ And there is a constraint $\sum_{i=1}^k p_i = 1$

$$\text{so, } H(X) = \sum_{x \in \mathcal{X}} p_x \log \frac{1}{p_x} = E\left[\log \frac{1}{p_x}\right]$$

By using Jensen's inequality, we can rewrite as

$$H(X) = E\left[\log \frac{1}{p_x}\right] \leq \log E\left[\frac{1}{p_x}\right]$$

$$= \log \sum_{x \in \mathcal{X}} p_x \cdot \frac{1}{p_x}$$

$$= \log |\mathcal{X}|$$

As desired, we prove that is upper bound of entropy.

Exercise 2.2

a). Firstly, we know $D(P_X \parallel U_X) = \sum_{x \in \mathcal{X}} P_X(x) \log \frac{P_X(x)}{U_X(x)} = \sum_{x \in \mathcal{X}} P_X(x) \log \frac{P_X(x)}{\frac{1}{|\mathcal{X}|}}$

$$= \sum_{x \in \mathcal{X}} P_X(x) \log \frac{P_X(x)}{\frac{1}{|\mathcal{X}|}}$$

$$H(X) = \sum_{x \in \mathcal{X}} P_X(x) \log \frac{1}{P_X(x)} = - \sum_{x \in \mathcal{X}} P_X(x) \log P_X(x)$$

$$= - \sum_{x \in \mathcal{X}} P_X(x) \log \left[\frac{1}{|\mathcal{X}|} \cdot \frac{P_X(x)}{\frac{1}{|\mathcal{X}|}} \right]$$

$$= - \sum_{x \in \mathcal{X}} P_X(x) \log \frac{1}{|\mathcal{X}|} - \sum_{x \in \mathcal{X}} P_X(x) \log \frac{P_X(x)}{\frac{1}{|\mathcal{X}|}}$$

$$= - \log \frac{1}{|\mathcal{X}|} - D(P_X \parallel U_X)$$

$$= \log |\mathcal{X}| - D(P_X \parallel U_X)$$

b) Firstly, we know $H(X|Y) = \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{X,Y}(x,y) \log \frac{1}{P_{X,Y}(x,y)}$

$$= - \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{X,Y}(x,y) \log \left[\frac{1}{|\mathcal{X}|} \cdot \frac{P_{X,Y}(x,y)}{\frac{1}{|\mathcal{X}|}} \right]$$

$$= - \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{X,Y}(x,y) \log \frac{1}{|\mathcal{X}|} - \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{X,Y}(x,y) \log \frac{P_{X,Y}(x,y)}{\frac{1}{|\mathcal{X}|}}$$

$$= - \log \frac{1}{|\mathcal{X}|} - \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{X,Y}(x,y) \log \frac{P_{X,Y}(x,y)}{P_Y \cdot \frac{1}{|\mathcal{X}|}}$$

$$= \log |\mathcal{X}| - D(P_{X,Y} \parallel U_X \times P_Y)$$

c) ~~B~~

From (a) and (b), we can get

$$\begin{aligned}
 I(x:y) &= H(x) - H(x|y) \\
 &= \log |x| - D(P_x || U_x) - [\log |x| - D(P_{xy} || U_x \times P_y)] \\
 &= D(P_{xy} || U_x \times P_y) - D(P_x || U_x) \\
 &= \sum_{x \in x, y \in y} P(x,y) \log \frac{P(x,y)}{P_y \cdot \frac{1}{|x|}} - \sum_{x \in x} P_x(x) \log \frac{P_x(x)}{\frac{1}{|x|}} \\
 &= \sum_{x \in x, y \in y} P(x,y) \log \frac{P(x,y)}{P_y \cdot \frac{1}{|x|}} - \sum_{x \in x, y \in y} P(x,y) \log \frac{P_x(x)}{\frac{1}{|x|}} \\
 &= \sum_{x \in x, y \in y} P(x,y) \cdot \log \frac{P(x,y)}{P_x \cdot P_y} \\
 &= D(P_{xy} || P_x \times P_y)
 \end{aligned}$$

Exercise 2.3

By setting the alphabet size at most 2 bits

$$\begin{aligned}
 a). H(x|yz) = 0 &\Rightarrow H(x|yz) = \sum_y \sum_z P_z H(x|y=z, z=z) = 0. \\
 &\Rightarrow P_{x|yz} = 0 \text{ or } P_{x|yz} = 1 \\
 H(x|y) = H(x|z) = 1 &\Rightarrow \sum_y P_y H(x|y=y) = \sum_z P_z H(x|z=z) = 0 \\
 &\Rightarrow P_{x|y} = \frac{1}{2} \text{ and } P_{x|z} = \frac{1}{2}
 \end{aligned}$$

For example

	x	y	z
①	0	0	0
②	1	0	1
③	1	1	0
④	0	1	1

$$\begin{aligned}
 b). I(x:y|z) = 1 &\Rightarrow H(y|z) - H(y|xz) = 1 \Rightarrow H(y|z) = 1 \text{ and } H(y|xz) = 0 \\
 &\Rightarrow P_{y|z} = \frac{1}{2} \text{ and } [P_{y|xz} = 0 \text{ or } P_{y|xz} = 1]
 \end{aligned}$$

$$I(x:y) = 0 \Rightarrow H(y) - H(y|x) = 0$$

For example

	x	y	z
①	0	0	1
②	0	1	0
③	1	0	0
④	1	1	1

FALCON

扫描全能王 创建

c) $I(x:y) = 1 \Rightarrow H(Y) - H(Y|x) = 1 \Rightarrow H(Y) = 1$ and $H(Y|x) = 0$

~~$I(x:y+z) = H(Y|Z) - H(Y|xZ)$~~ $\Rightarrow Y$ is uniform distributed
 $\Rightarrow P_{Y|x} = 1$ or 0

And $I(x:y|z) = H(Y|Z) - H(Y|xZ) = 0$

for example:

	x	y	z
①	0	0	0
②	0	1	0
③	1	0	1
④	1	1	0

d) $I(x:y) = I(x:z) = 1 \Rightarrow H(Y) - H(Y|x) = 1$ and $H(Z) - H(Z|x) = 1$

But for $I(y:z) = 0 \Rightarrow$

$P_{Y|x} = 0$ or 1 / $P_{Z|x} = 0$ or 1

so, for example:

	x	y	z
①	0	0	1
②	1	0	0

Exercise 2.5

For the first part, if we know x_1, x_2, \dots, x_n are mutually independent so, $I(x_1, \dots, x_n : y_1, \dots, y_n) = H(x_1, x_2, \dots, x_n) - H(x_1, x_2, \dots, x_n | y_1, y_2, \dots, y_n)$

$= H(x_1) + H(x_2 | x_1) + \dots + H(x_n | x_{n-1}) - H(x_1, x_2, \dots, x_n | y_1, y_2, \dots, y_n)$

Because x_1, \dots, x_n are mutual independent, ~~we~~ we can rewrite above equation

$= H(x_1) + H(x_2) + \dots + H(x_n) - H(x_1, x_2, \dots, x_n | y_1, y_2, \dots, y_n)$

$= H(x_1) + H(x_2) + \dots + H(x_n) - [H(x_1 | y_1, y_2, \dots, y_n) + H(x_2 | x_1, y_1, y_2, \dots, y_n) + \dots + H(x_n | x_1, \dots, x_{n-1}, y_1, \dots, y_n)]$

~~Using $H(x_1, \dots, x_n) \leq H(x_1 | y_1)$~~

$= \sum_{i=1}^n H(x_i) - [H(x_1 | y_1, y_2, \dots, y_n) + \dots + H(x_n | y_1, \dots, y_n)]$

Using to $H(x_1 | y_1, y_2, \dots, y_n) \leq H(x_1 | y_1)$, $H(x_2 | y_1, \dots, y_n) \leq H(x_2 | y_2)$
 $\dots, H(x_n | y_1, \dots, y_n) \leq H(x_n | y_n)$

so for above ~~equation~~ statement, we can rewrite

$\geq \sum_{i=1}^n H(x_i) - [H(x_1 | y_1) + \dots + H(x_n | y_n)]$
 $= \sum_{i=1}^n H(x_i) - \sum_{i=1}^n H(x_i | y_i)$
 $= \sum_{i=1}^n I(x_i : y_i)$

And for the second part, if we know X_i is conditional independent of all the remaining random variables, given Y_i

$$\begin{aligned} \text{so, } I(X_1 \dots X_n; Y_1 \dots Y_n) &= H(X_1, X_2 \dots X_n) - H(X_1, X_2 \dots X_n | Y_1, Y_2 \dots Y_n) \\ &= H(X_1) + H(X_2 | X_1) + \dots + H(X_n | X_{n-1}) \\ &\quad - [H(X_1 | Y_1, Y_2 \dots Y_n) + H(X_2 | X_1, Y_1 \dots Y_n) + \dots + H(X_n | X_1 \dots X_{n-1}, Y_1 \dots Y_n)] \\ &= H(X_1) + H(X_2 | X_1) + \dots + H(X_n | X_{n-1}) \\ &\quad - [H(X_1 | Y_1) + H(X_2 | Y_2) + \dots + H(X_n | Y_n)] \end{aligned}$$

Due to ~~$H(X_2)$~~ $H(X_2 | X_1) \leq H(X_2)$

$$H(X_n | X_{n-1}) \leq H(X_n)$$

Therefore, above equation, we can rewrite

$$\begin{aligned} &\leq H(X_1) + H(X_2) + \dots + H(X_n) - [H(X_1 | Y_1) + H(X_2 | Y_2) + \dots + H(X_n | Y_n)] \\ &= \sum_{i=1}^n H(X_i) - \sum_{i=1}^n H(X_i | Y_i) \\ &= \sum_{i=1}^n I(X_i; Y_i) \end{aligned}$$

In a word, the proof is finished.
